

This is the first indicator of error that I saw yesterday (March 31, 2022)

Upon opening each of the services under CONFIGURE SYSTEM, I saw that the status on RIM is stopped.

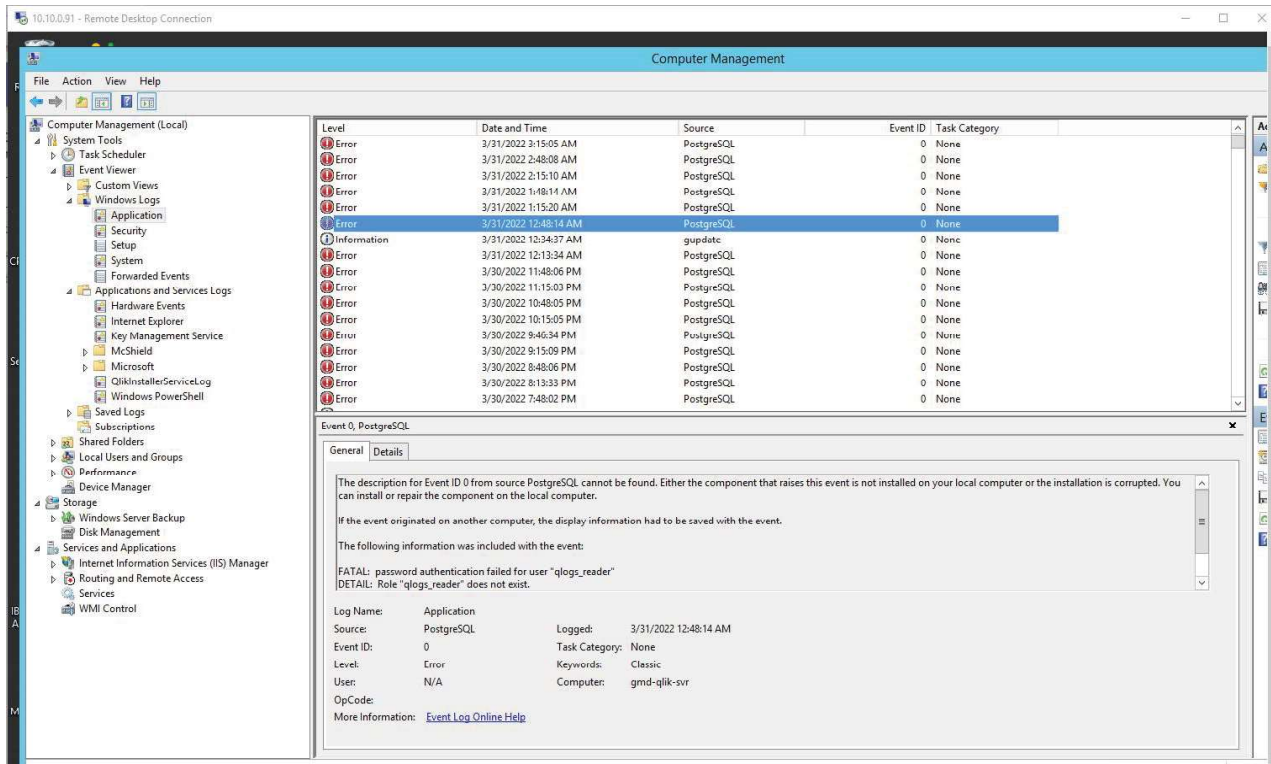

The Node doesn't show any sign of error, but as I checked it, it shows the services that are not running on the RIM node.

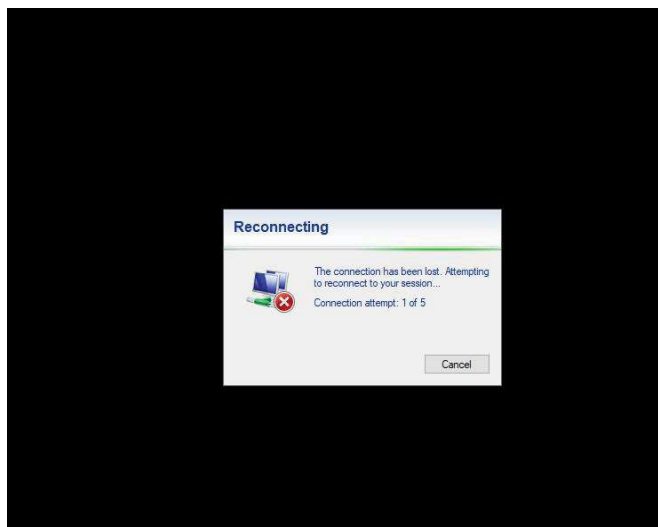

I tried to check on both servers (QLIKand ETL) whether the services are running or not, and the status says it's all running.

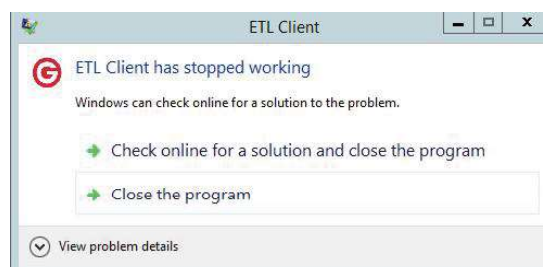

I am not sure if the following errors are relevant to the issue, but I'd like to show these as part of my observation while monitoring.

PostgreSQL in QLIK server

Occured twice in the morning while I was remoting the ETL server

Prompts when I open the ETL app in the morning.
(the app and logs shows ETL FINISH though)
